Thought of the Week

Some of our greatest fears about the European debt crisis have to do with the risk of contagion spreading from the periphery to larger core countries. During the second half of last year, those fears looked like they might materialize, as Italian and Spanish bond yields quickly rose to unsustainable levels. Although the ECB has taken steps to inject virtually unlimited amounts of money into the economy and banking system, tail risks, particularly in the banking sector, seem to be contained. While yields on Spanish and Italian bonds have come down, Greek bonds continue to be priced for default, likely portraying the time bought with liquidity and the amount of structural reform needed. Greek reforms have a long way to go, but fresh liquidity helps by removing some channels of possible contagion.

Question of the week:

Under current law, what will be the top marginal tax rate starting in January 2013?

Prior week's question:

The January employment report showed that there were 12.8 million unemployed people; when was the last time the number of unemployed people was this low?

Answer to prior week's question:

This was the lowest level of unemployed people since January 2009.
